Thanks Mark. We have it nearly done – I will just send you what we have after I look over the plots.

Mark (Craig), Eric and Jeff – Did you all get the EMME/2 data banks, Synchro files and VISSIM files from the end of the work that Mirai and PB did in December. I had requested DVDs to each agency for their use. If you did not, I can follow that up to make sure you have the data banks and files so you have the last point we left things in December.

Craig H/Eric T and Jeff F – please confirm with me.

Hi Randy,

I've got somebody already working on it so you don't need to worry about it.

Bob/Ron - should have it for you end of the day Monday.

Mark

We can pull together some volume difference plots for these area from the scenario travel model stuff – to pull up the data banks will take a little time – can get some data out on Monday if that works. We did a table (see attached DRAFT material) for 45th/50th/85th. But you are asking more Ballard oriented questions than the table addressed.

Can you please develop a one pager that addresses the following:

We keep hearing that the following routes will see significant volume increases as NW Seattle accesses the bored tunnel;

46th to SR 99

39th to SR 99

Leary Way to Dexter to Mercer Corridor to SR 99

Nickerson St to Westlake to mercer Corridor to SR 99

We have data (somewhere) from scenario F that (as I recall) addresses this concern ... Do we have AM peak percent increases? PM peak percent increases? Existing volumes compared to projected volumes?
